# Vector Fields and Dynamical Systems (1)

## Velocity gradient tensor, (vector field $\rightarrow$ tensor field)

- Gradient of vector field: how does the vector field change?
- In Cartesian coordinates: *spatial partial derivatives (Jacobian matrix)*

$$\nabla \mathbf{v} (x, y, z) = \begin{pmatrix} u_x & u_y & u_z \\ v_x & v_y & v_z \\ w_x & w_y & w_z \end{pmatrix} \quad \text{these are partial derivatives!}$$

- Can be decomposed into *symmetric* part + *anti-symmetric* part

$$\nabla \mathbf{v} = \mathbf{D} + \mathbf{S}$$

*velocity gradient tensor*

sym.:  $\mathbf{D} = \frac{1}{2} ( \nabla \mathbf{v} + (\nabla \mathbf{v})^T )$

deform.: *rate-of-strain tensor*

skew-sym.:  $\mathbf{S} = \frac{1}{2} ( \nabla \mathbf{v} - (\nabla \mathbf{v})^T )$

rotation: *vorticity/spin tensor*

# Vector Fields and Dynamical Systems (2)

## Vorticity/spin/angular velocity tensor

- Antisymmetric part of velocity gradient tensor
- Corresponds to vorticity/curl/angular velocity (beware of factor  $\frac{1}{2}$ )

$$\mathbf{S} = \frac{1}{2} ( \nabla \mathbf{v} - (\nabla \mathbf{v})^T )$$

these are  
partial  
derivatives!

$$\mathbf{S} = \frac{1}{2} \begin{pmatrix} 0 & -\omega_3 & \omega_2 \\ \omega_3 & 0 & -\omega_1 \\ -\omega_2 & \omega_1 & 0 \end{pmatrix} \quad \omega = \begin{pmatrix} \omega_1 \\ \omega_2 \\ \omega_3 \end{pmatrix} = \nabla \times \mathbf{v} = \begin{pmatrix} w_y - v_z \\ u_z - w_x \\ v_x - u_y \end{pmatrix}$$

$\mathbf{S}$  acts on vector like cross product with  $\omega$ :  $\mathbf{S} \cdot = \frac{1}{2} \omega \times$

$$\mathbf{v}^{(r)} = \mathbf{S} \cdot d\mathbf{r} = \frac{1}{2} [ \nabla \mathbf{v} - (\nabla \mathbf{v})^T ] \cdot d\mathbf{r} = \frac{1}{2} \omega \times d\mathbf{r}$$

# Angular Velocity of Rigid Body Rotation

## Rate of rotation

- Scalar  $\omega$ : angular displacement per unit time ( $\text{rad s}^{-1}$ )
  - Angle  $\Theta$  at time  $t$  is  $\Theta(t) = \omega t$ ;  $\omega = 2\pi f$  where  $f$  is the frequency ( $f = 1/T$ ;  $\text{s}^{-1}$ )
- Vector  $\boldsymbol{\omega}$ : axis of rotation; magnitude is angular speed (if  $\boldsymbol{\omega}$  is curl: speed  $\times 2$ )
  - Beware of different conventions that differ by a factor of  $\frac{1}{2}$  !

Cross product of  $\frac{1}{2}\boldsymbol{\omega}$  with vector to center of rotation ( $\mathbf{r}$ ) gives linear velocity vector  $\mathbf{v}$  (tangent)

$$\mathbf{v}^{(r)} = \frac{1}{2} \boldsymbol{\omega} \times d\mathbf{r}$$

# Velocity Gradient Tensor and Components (1)

## Velocity gradient tensor

(here: in Cartesian coordinates)

$$\nabla \mathbf{v} = \begin{bmatrix} \frac{\partial}{\partial x} v^x & \frac{\partial}{\partial y} v^x & \frac{\partial}{\partial z} v^x \\ \frac{\partial}{\partial x} v^y & \frac{\partial}{\partial y} v^y & \frac{\partial}{\partial z} v^y \\ \frac{\partial}{\partial x} v^z & \frac{\partial}{\partial y} v^z & \frac{\partial}{\partial z} v^z \end{bmatrix}$$

these are the same  
partial derivatives  
as before!

$$\nabla \mathbf{v} = \frac{1}{2} \left( \nabla \mathbf{v} + (\nabla \mathbf{v})^T \right) + \frac{1}{2} \left( \nabla \mathbf{v} - (\nabla \mathbf{v})^T \right)$$

# Velocity Gradient Tensor and Components (2)

## Rate-of-strain (rate-of-deformation) tensor

(symmetric part; here: in Cartesian coordinates)

$$\mathbf{D} = \frac{1}{2} \begin{bmatrix} 2\frac{\partial}{\partial x}v^x & \frac{\partial}{\partial y}v^x + \frac{\partial}{\partial x}v^y & \frac{\partial}{\partial z}v^x + \frac{\partial}{\partial x}v^z \\ \frac{\partial}{\partial x}v^y + \frac{\partial}{\partial y}v^x & 2\frac{\partial}{\partial y}v^y & \frac{\partial}{\partial z}v^y + \frac{\partial}{\partial y}v^z \\ \frac{\partial}{\partial x}v^z + \frac{\partial}{\partial z}v^x & \frac{\partial}{\partial y}v^z + \frac{\partial}{\partial z}v^y & 2\frac{\partial}{\partial z}v^z \end{bmatrix}$$

$$tr(\mathbf{D}) = \nabla \cdot \mathbf{v}$$

# Velocity Gradient Tensor and Components (3)

## Vorticity tensor (spin tensor)

(skew-symmetric part; here: in Cartesian coordinates)

$$\mathbf{S} = \frac{1}{2} \begin{bmatrix} 0 & \frac{\partial}{\partial y} v^x - \frac{\partial}{\partial x} v^y & \frac{\partial}{\partial z} v^x - \frac{\partial}{\partial x} v^z \\ \frac{\partial}{\partial x} v^y - \frac{\partial}{\partial y} v^x & 0 & \frac{\partial}{\partial z} v^y - \frac{\partial}{\partial y} v^z \\ \frac{\partial}{\partial x} v^z - \frac{\partial}{\partial z} v^x & \frac{\partial}{\partial y} v^z - \frac{\partial}{\partial z} v^y & 0 \end{bmatrix}$$

$$\mathbf{S} = \frac{1}{2} \begin{bmatrix} 0 & -\omega_z & \omega_y \\ \omega_z & 0 & -\omega_x \\ -\omega_y & \omega_x & 0 \end{bmatrix} \quad \boldsymbol{\omega} \equiv \nabla \times \mathbf{v}$$

# Critical Point Analysis

# Critical Points (Steady Flow!)

Classify critical points according to the *eigenvalues* of the velocity gradient tensor at the critical point

stream lines (LIC)

critical points ( $\mathbf{v} = 0$ )

# (Non-Linear) Dynamical Systems

Start with system of linear ODEs (with constant coefficients)

- Non-linear systems can be linearized around critical points
- Use linearization for characterization

$$\dot{\mathbf{x}} = A\mathbf{x}$$

$A$  is an  $n \times n$  matrix

$$\begin{aligned}\mathbf{v} &= A\mathbf{x}, \\ \nabla \mathbf{v} &= A.\end{aligned}$$

$$\dot{\mathbf{x}} = \frac{d\mathbf{x}}{dt} = \begin{bmatrix} \frac{dx_1}{dt} \\ \vdots \\ \frac{dx_n}{dt} \end{bmatrix}$$

$$\mathbf{x}(0) = \mathbf{x}_0$$

$$\text{solution: } \mathbf{x}(t) = e^{At}\mathbf{x}_0$$

characterize behavior  
through eigenvalues of  $A$

# A Few Facts about Eigenvalues and –vectors

The matrix  $\begin{bmatrix} c & -s \\ s & c \end{bmatrix}$  has eigenvalues  $\lambda_1 = c + s\mathbf{i}$   $\lambda_2 = c - s\mathbf{i}$   
with eigenvectors  $u_1 = \begin{bmatrix} 1 \\ -\mathbf{i} \end{bmatrix}$   $u_2 = \begin{bmatrix} 1 \\ +\mathbf{i} \end{bmatrix}$

If  $c = 0$ , this is a skew-symmetric matrix

Skew-symmetric matrices: “infinitesimal rotations” (infinitesimal generators of rot.)

For  $c = \cos \theta$  and  $s = \sin \theta$ : 2x2 rotation matrix with  $\lambda_1 = e^{\mathbf{i}\theta} = \cos \theta + \mathbf{i} \sin \theta$

$$\lambda_2 = e^{-\mathbf{i}\theta} = \cos \theta - \mathbf{i} \sin \theta$$

Eigenvalues

- Symmetric matrix: all eigenvalues are *real*
- Skew-symmetric matrix: all eigenvalues are *pure imaginary*

# Euler's Formula

Can be derived from the infinite power series for  $\exp()$ ,  $\cos()$ ,  $\sin()$

$$e^{ix} = \cos x + i \sin x$$

$$e^{i\pi} + 1 = 0$$

# Critical Points (Steady Flow!)

Poincaré Diagram: Classification of Phase Portraits in the  $(\det A, \text{Tr } A)$ -plane

# Matrix Exponentials

Defined via same power series as usual exponential

$$\exp(X) = e^X := \sum_{k=0}^{\infty} \frac{X^k}{k!} = I + X + \frac{X^2}{2!} + \frac{X^3}{3!} + \dots$$

Easy if  $X$  is diagonalizable

$$X = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \quad \exp(tX) = \begin{pmatrix} e^{\lambda_1 t} & 0 \\ 0 & e^{\lambda_2 t} \end{pmatrix}$$

Exponentials of anti-symmetric matrices are rotation matrices

$$X = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} \quad \exp(tX) = \begin{pmatrix} \cos t & -\sin t \\ \sin t & \cos t \end{pmatrix}$$

# Matrix Exponentials

Defined via same power series as usual exponential

$$\exp(X) = e^X := \sum_{k=0}^{\infty} \frac{X^k}{k!} = I + X + \frac{X^2}{2!} + \frac{X^3}{3!} + \dots$$

Easy if  $X$  is diagonalizable

$$X = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \quad \exp(tX) = \begin{pmatrix} e^{\lambda_1 t} & 0 \\ 0 & e^{\lambda_2 t} \end{pmatrix}$$

Complex eigenvalues lead to rotation

$$X = \begin{pmatrix} a & -\omega \\ \omega & a \end{pmatrix} \quad \exp(tX) = e^{at} \begin{pmatrix} \cos \omega t & -\sin \omega t \\ \sin \omega t & \cos \omega t \end{pmatrix}$$

$$\lambda_{1,2} = a \pm \mathbf{i}\omega$$

# Classification of Critical Points

(Isolated) critical point (equilibrium point)

- Velocity vanishes (all components zero)

$$\mathbf{v}(\mathbf{x}_c) = \mathbf{0} \quad \text{with} \quad \mathbf{v}(\mathbf{x}_c \pm \epsilon) \neq \mathbf{0} \quad \det(\nabla \mathbf{v}(\mathbf{x}_c)) \neq 0$$

Characterize using velocity gradient  $\nabla \mathbf{v}$  at critical point  $\mathbf{x}_c$

- Look at eigenvalues (and eigenvectors) of  $\nabla \mathbf{v}$

Repelling node  
 $R_1, R_2 > 0$   
 $I_1 = I_2 = 0$

Saddle point  
 $R_1 < 0, R_2 > 0$   
 $I_1 = I_2 = 0$

Attracting node  
 $R_1, R_2 < 0$   
 $I_1 = I_2 = 0$

Repelling focus  
 $R_1 = R_2 > 0$   
 $I_1 = -I_2 \neq 0$

Center  
 $R_1 = R_2 = 0$   
 $I_1 = -I_2 \neq 0$

Attracting focus  
 $R_1 = R_2 < 0$   
 $I_1 = -I_2 \neq 0$

the first three phase portraits are special cases, see later slides!

# A Few Details (1)

## Repelling/attracting nodes

- Do not necessarily imply that streamlines are straight lines (do not confuse with the linear system of ODEs!)
- They are only straight lines when both eigenvalues are real and have the same sign, *and are also equal* (as in the phase portraits before)
- If they are not equal:

**Repelling Node**

$$R_1, R_2 > 0$$

$$I_1, I_2 = 0$$

**Attracting Node**

$$R_1, R_2 < 0$$

$$I_1, I_2 = 0$$

## A Few Details (2)

What about skew axes?

- Both of the systems below have eigenvalues 3 and 6
- Jordan normal form (Jordan canonical form) gives details

$$\begin{bmatrix} 3 & 0 \\ 0 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 4 & 1 \\ 2 & 5 \end{bmatrix}$$

# Jordan Normal Form (2x2 Matrix)

For every real 2x2 matrix  $A$  there is an invertible  $P$  such that

$P^{-1}AP$  is one of the following Jordan matrices (all entries are real):

$$J_1 = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} \quad J_2 = \begin{bmatrix} \lambda & 0 \\ 1 & \lambda \end{bmatrix} \quad (\text{defective matrix})$$

$$J_3 = \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} \quad J_4 = \begin{bmatrix} a & -b \\ b & a \end{bmatrix}$$

Each of these has its corresponding rule for constructing  $P$

- Example on prev. slide (the two eigenvectors are not orthogonal):

$$P = \frac{1}{3} \begin{bmatrix} 1 & 1 \\ -1 & 2 \end{bmatrix} \quad \frac{1}{3} \begin{bmatrix} 2 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 4 & 1 \\ 2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 0 \\ 0 & 6 \end{bmatrix}$$

See also *algebraic* and *geometric multiplicity* of eigenvalues

# Jordan Normal Form (2x2 Matrix)

For every real 2x2 matrix  $A$  there is an invertible  $P$  such that

$P^{-1}AP$  is one of the following Jordan matrices (all entries are real):

$$J_1 = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

$$J_2 = \begin{bmatrix} \lambda & 0 \\ 1 & \lambda \end{bmatrix} \text{ (defective matrix)}$$

same eigenvalues,  
trace, determinant!

$$J_3 = \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}$$

$$J_4 = \begin{bmatrix} a & -b \\ b & a \end{bmatrix}$$

Each of these has its corresponding rule for constructing  $P$

- Example on prev. slide (the two eigenvectors are not orthogonal):

$$P = \frac{1}{3} \begin{bmatrix} 1 & 1 \\ -1 & 2 \end{bmatrix} \quad \frac{1}{3} \begin{bmatrix} 2 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 4 & 1 \\ 2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 0 \\ 0 & 6 \end{bmatrix}$$

See also *algebraic* and *geometric multiplicity* of eigenvalues

# Another Example

$P^{-1}AP$  has form  $J_1$

Eigenvalues:

$$\lambda_1 = -1$$

$$\lambda_2 = 2$$

$$A = \begin{bmatrix} -1 & -3 \\ 0 & 2 \end{bmatrix}$$

$$P = \begin{bmatrix} 1 & -1 \\ 0 & 1 \end{bmatrix} \quad P^{-1} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$$

# Jordan Form Characterization (1)

Phase portraits corresponding to Jordan matrix

$$J_1 = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

$0 < \lambda_1 < \lambda_2$   
unstable node

$\lambda_1 < 0 < \lambda_2$   
saddle

$\lambda_1 < \lambda_2 < 0$   
stable node

## Jordan Form Characterization (2)

Phase portraits corresponding to Jordan matrix  
(matrix is defective: eigenspaces collapse,  
geometric multiplicity less than algebraic multiplicity)

$$J_2 = \begin{bmatrix} \lambda & 0 \\ 1 & \lambda \end{bmatrix}$$

$$\lambda < 0$$

stable improper node

$$\lambda > 0$$

unstable improper node

# Jordan Form Characterization (3)

Phase portraits corresponding to Jordan matrix

$$J_3 = \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}$$

$\lambda < 0$   
stable star node

$\lambda > 0$   
unstable star node

# Jordan Form Characterization (4)

Phase portraits corresponding to Jordan matrix

$$J_4 = \begin{bmatrix} a & -b \\ b & a \end{bmatrix}$$

$a < 0$   
stable spiral node

$a = 0$   
center

$a > 0$   
unstable spiral node

# Critical Points (Steady Flow!)

Classify critical points according to the *eigenvalues* of the velocity gradient tensor at the critical point

stream lines (LIC)

critical points ( $\mathbf{v} = 0$ )

# Vector Field Topology: Topological Skeleton

Connect critical points by *separatrices*

Sources (red), sinks (blue), saddles (yellow)

# Vector Field Topology: Topological Skeleton

Connect critical points by *separatrices*

# Index of Critical Points / Vector Fields

*Poincaré index* (in scalar field topology we had the *Morse index*)

- Can compute index (winding number) for each critical point
- Index of a region is the sum of the critical point indexes inside
- Sum of all indexes over a manifold is its Euler characteristic

Do a loop (Jordan curve) around each critical point: the index is its (Brouwer) degree: integer how often the vector field along the loop turns around (determined by angle 1-form integrated over oriented 1-manifold)

$$\text{index}_\gamma = \frac{1}{2\pi} \oint_\gamma d\alpha$$

$$\alpha = \arctan \frac{v}{u}$$

index = +1

index = +1

index = +1

index = -1

# Higher-Order Critical Points

Higher than first-order

- Sectors can be elliptic, parabolic, hyperbolic
- For index sum over number of elliptic and hyperbolic sectors

$$\text{index}_{cp} = 1 + \frac{n_e - n_h}{2}$$

index +2

(dipole)

index +3

index -2

(see monkey saddle)

index -3

# Example: Differential Topology

## Topological information from vector fields on manifold

- Independent of actual vector field! Poincaré-Hopf theorem
- Useful constraints: vector field editing, simplification, sphere always has critical point, ...

Topological invariant: Euler characteristic  $\chi(M)$  of manifold  $M$   
(for 2-manifold mesh:  $\chi(M) = V - E + F$ )

$$\chi = 2 - 2g \quad (\text{orientable})$$

genus  $g = 0$   
Euler characteristic  $\chi = 2$

genus  $g = 1$   
Euler characteristic  $\chi = 0$

genus  $g = 2$   
Euler characteristic  $\chi = -2$
